

UX/UI Redesign Specification

Product Module: KimFam Hub — Project Portfolio & Venture Directory

Document Purpose: Product Management handover notes for UI/UX implementation engineers. This brief details identified usability friction points, design choices, and structurally mapped solutions to transition the interface to a premium dark ecosystem.

1. Design Critique: Core Usability Pitfalls

- **High Contrast Fatigue (Dark-on-Dark Over-saturation):** The existing layout depends heavily on dense, highly saturated neon borders and deep blue content wells over true blacks. This approach results in elevated cognitive friction and optical fatigue during prolonged management review sessions.
- **Structural Anarchy & Element Collision:** Lack of distinct vertical padding forces secondary text blocks (e.g., "TEAM INTEREST 2") directly into bounding boxes, disrupting normal hierarchy paths.
- **Disjointed Interactive Elements:** Inconsistent radius values across navigation controls paired with an overly intense call-to-action button color block (" + Interest ") distracts the user from absorbing the core metric matrix.
- **Distorted In-line Attachments:** Unprocessed image attachments are dynamically jammed into compressed aspect containers, forcing premature text clipping and uneven image distribution across the card footer.

2. Architectural & Blueprint Layout Mapping

The structural framework below defines the component layout stack to maximize viewport space on mobile and isolate information blocks logically:

3. Engineering & UX Implementation Directives

Color Hierarchy & Context Depth

- **Canvas Specification:** Deprecate absolute blacks and stark blues. Migrate base container canvas to #121824 with a standard card layout background of #1E293B.
- **Status Indicators:** Convert loud neon borders into subtle, self-contained status badge pills utilizing low-saturation background tints (e.g., desaturated forest green fill with soft mint text strings).

Typography Hierarchy

- **System Font Stack:** Implement clean modern sans-serifs exclusively (e.g., *Inter*, *SF Pro*).
- **Sizing Framework:** Main card header titles set to 14pt (Bold, White); sub-categories/ownership blocks set to 10.5pt (Muted Silver, Regular). Key operation metrics must occupy a high-visibility hero panel with distinct, generous baseline tracking.

Micro-interactions & Functional Grouping

- **Action Prioritization:** Secondary operational pathways ("*Analysis*" / "*Audit*") must be structured as inline paired outline buttons sharing uniform border-radius values (8px).
- **De-escalation of Interest Action:** Re-engineer the primary "+ *Interest*" action from an overwhelming full-color block to an elegant sub-action element, balancing visibility without obscuring nearby data points.

Smart Component Architecture (Accordion Pattern)

- **Noise Reduction:** Transition the active "*Team Interest*" list into a collapsible interactive accordion panel. The default state must remain collapsed, revealing item lines only via user-triggered expand-toggles.

Media Standardisation & Navigation Elements

- **Document Attachment Matrix:** Anchor individual images inside predefined uniform bounding boxes featuring identical corner aspect ratios and subtle border definitions. Overlapping item stacks must feature a standard +X counter overlay for asset counts greater than three.
- **Global System Navigation:** Swap out multi-colored, non-uniform system icons on the global navigation bar for a unified, monochromatic line iconography set (e.g., *Lucide-react* or *Phosphor* standard packs).
